A negative electrode of a nonaqueous electrolyte secondary battery, which is provided with a collector and a negative electrode active material layer that is formed on the collector, and which is characterized in that: the negative electrode active material layer contains a carbon-based negative electrode active material, a silicon-based negative electrode active material, a conductive agent and a predetermined carboxy methylcellulose or a salt thereof; the content of the carboxy methylcellulose or a salt thereof is from 4% by mass to 15% by mass (inclusive) relative to the total mass of the negative electrode active material layer; and the content of the silicon-based negative electrode active material relative to the total content of the carbon-based negative electrode active material and the silicon-based negative electrode active material is from 3% by mass to 19% by mass (inclusive).

本发明提供一种非水电解质二次电池负极以及具有优异的循环寿命的非水电解质二次电池，该非水电解质二次电池负极为环境负荷少的水系的配方，且为简易的配方，并且能够利用无需热固化处理等的工序来制造。一种非水电解质二次电池负极，其具备集电体及形成在集电体上的负极活性物质层，该非水电解质二次电池负极的特征在于：上述负极活性物质层含有碳系负极活性物质、硅系负极活性物质、导电剂以及规定的羧甲基纤维素或其盐，相对于所述负极活性物质层的总质量，羧甲基纤维素或其盐的含量为4质量%以上且15质量%以下，相对于所述碳系负极活性物质与硅系负极活性物质的合计含量，硅系负极活性物质的含量为3质量%以上且19质量%以下。

BINDING AGENT FOR LITHIUM SECONDARY BATTERY NEGATIVE ELECTRODE  
リチウム二次電池の負極用接着剤

### 摘要 显示

PROBLEM TO BE SOLVED: To provide a binding agent which is used in forming an electrode layer using silicon solely or a composite thereof as a negative electrode active material, and which can maintain its binding property despite volume expansion and contraction of the active material during charge and discharge.SOLUTION: A binding agent for a lithium secondary battery negative electrode comprises polyurethane water dispersion. The polyurethane water dispersion includes at least a hydrophilic group-

containing polyurethane produced by use of an organic polyisocyanate and a compound having one or more active hydrogen groups. A content of the organic polyisocyanate is 50-80 mass% to the hydrophilic group-containing polyurethane. The compound having one or more active hydrogen groups includes a compound having two or more active hydrogen groups, and a compound having one or more active hydrogen groups and one or more ionic hydrophilic groups. The negative electrode is formed by using a silicon-containing material solely or a composite thereof as a negative electrode active material. The hydrophilic group-containing polyurethane includes an aromatic ring structure or an alicyclic structure, in which a content of the aromatic ring structure or alicyclic structure is 40 mass% or more.

### 标题

BINDER FOR ELECTRODE OF LITHIUM SECONDARY  
CELL  
LIANT POUR ÉLECTRODE DE PILE RECHARGEABLE  
AU LITHIUM

### 摘要

[显示](#)

The present invention addresses the problem of providing a binder such that, when an electrode layer in which silicon or a silicon composite is used is formed in a negative electrode active material, the binder exhibits consistent performance despite fluctuation in the volume of the active material during charging and discharging. A binder for an electrode of a lithium secondary cell containing a polyurethane aqueous dispersion, wherein said binder is characterized in that the polyurethane aqueous dispersion contains a hydrophilic-group-containing polyurethane obtained using at least (A) an organic polyisocyanate and (B) a compound that has at least one active hydrogen group, the amount of (A) being 50-80% by mass in relation to the hydrophilic-group-containing polyurethane, and the compound (B) having at least one active hydrogen group containing a compound (B1) having at least two active hydrogen groups, and a compound (B2) having at least one active hydrogen group and at least one ionic hydrophilic group.

La présente invention concerne un liant qui présente, lorsqu'une couche d'électrode, dans laquelle du silicium ou un composé du silicium est utilisé, est formée en un matériau actif d'électrode négative, une efficacité constante malgré une fluctuation du volume du matériau actif pendant la charge et la décharge. Un

liant, pour une électrode d'une pile rechargeable au lithium contenant une dispersion aqueuse de polyuréthane, est décrit, ledit liant étant caractérisé en ce que la dispersion aqueuse de polyuréthane contient un polyuréthane contenant un groupe hydrophile obtenu en utilisant au moins (A) un polyisocyanate organique et (B) un composé qui possède au moins un groupe hydrogène actif, la quantité de (A) étant de 50 à 80% en masse par rapport au polyuréthane contenant un groupe hydrophile, et le composé (B) qui possède au moins un groupe hydrogène actif contenant un composé (B1) ayant au moins deux groupes hydrogène actifs, et un composé (B2) ayant au moins un groupe hydrogène actif et au moins un groupe hydrophile ionique.

### 摘要

显示

The present invention provides an electrode material which is for a lithium-ion battery or a lithium-ion

capacitor, and which compensates for the disadvantages of a hydrophobic active material, imparts hydrophilic properties to a hydrophobic active material, and can exhibit excellent dispersibility, without causing a decrease in electrode properties. Specifically provided is an electrode material for a lithium-ion battery or for a lithium-ion capacitor, wherein the electrode material includes a composite powder in which a B component is supported on or coats the surface of an A component, the A component comprises a material capable of electrochemically storing and discharging lithium ions, the B component is sulfur-modified cellulose, and the amount of the B component is at least 0.01 mass% in terms of 100 mass% as the total amount of the A component and the B component.

電極特性を低下させることなく、疎水性の活物質の欠点を補い、疎水性の活物質に親水性を付与し、優れた分散性を発揮できるリチウムイオン電池用またはリチウムイオンキャパシタ用の電極材料を提供する。リチウムイオン電池用またはリチウムイオンキャパシタ用の電極材料であって、前記電極材料は、A成分の表面にB成分が担持または被覆された複合粉末を含み、A成分がリチウムイオンを電気化学的に吸蔵および放出することができる材料からなり、B成分が、硫黄変性セルロースであり、前記A成分および前記B成分の合計量100質量%に対し、前記B成分が0.01質量%以上である、リチウムイオン電池用またはリチウムイオンキャパシタ用の電極材料。

### 标题

NEGATIVE ELECTRODE BINDER FOR LITHIUM SECONDARY BATTERY

### 摘要

[显示](#)

PROBLEM TO BE SOLVED: To provide a binder exhibiting excellent electrochemical stability and excellent lithium secondary battery performance in an electrochemically severe state in the battery, while holding the function as a dispersant or a leveling agent in a step of coating on a collector, dispersing an electrode active material, or the like, into a dispersion medium, such as water or a solvent, in a process for manufacturing a lithium secondary battery.SOLUTION: In the binder for a lithium secondary battery negative electrode containing a carboxymethyl cellulose lithium salt, etherification degree of the carboxymethyl cellulose lithium salt is 0.50-1.00, and 1% viscosity is preferably 300-2500 mPa s.

## 标题

BINDER FOR ELECTRODE IN LITHIUM SECONDARY CELL, ELECTRODE MANUFACTURED USING SAID BINDER, AND LITHIUM SECONDARY CELL IN WHICH SAID ELECTRODE IS USED  
LIANT POUR UNE ÉLECTRODE DANS UNE CELLULE SECONDAIRE AU LITHIUM, ÉLECTRODE FABRIQUÉE EN UTILISANT LEDIT LIANT ET CELLULE SECONDAIRE AU LITHIUM DANS LAQUELLE LADITE ÉLECTRODE EST UTILISÉE

## 摘要

显示

Provided is an electrode binder for a lithium secondary cell containing an aqueous dispersion of a polyurethane comprising (A) a polyisocyanate, (B) a compound having two or more active hydrogen groups, (C) a compound having one or more active hydrogen groups and hydrophilic groups, and (D) a chain extender, wherein the binder adheres firmly enough to a current collector to prevent separation during press-working, the binder having high flexibility and excellent bonding and electrolyte resistance. Also provided are an electrode manufactured using said binder, and a lithium secondary cell using said electrode and having excellent charging and discharging performance. There is used an electrode binder containing an aqueous dispersion of a polyurethane in which compound (B) having two or more active hydrogen groups contains an olefinic polyol and/or a carbonate diol having fewer than six carbons between carbonate bonded chains.

L'invention porte sur un liant d'électrode pour une cellule secondaire au lithium contenant une dispersion aqueuse d'un polyuréthane comprenant (A) un polyisocyanate, (B) un composé ayant au moins deux groupes d'hydrogène actif, (C) un composé ayant un ou plusieurs groupes d'hydrogène actif et des groupes hydrophiles, et (D) un allongeur de chaîne, le liant se fixant assez fermement à un collecteur de courant pour empêcher une séparation durant un travail de pressage, le liant ayant une flexibilité élevée et d'excellentes liaison et résistance d'électrolyte. L'invention porte également sur une

électrode fabriquée en utilisant ledit liant, et sur une cellule secondaire au lithium utilisant ladite électrode et ayant d'excellentes performances de charge et de décharge. Il est utilisé un liant d'électrode contenant une dispersion aqueuse d'un polyuréthane dans lequel un composé (B) ayant au moins deux groupes d'hydrogène actif contient un polyol oléfinique et/ou un diol de carbonate ayant moins de six carbones entre des chaînes liées par carbonate.

BINDER FOR ELECTRODES OF LITHIUM  
SECONDARY BATTERIES, ELECTRODE PRODUCED  
USING SAID BINDER, AND LITHIUM SECONDARY  
BATTERY USING SAID ELECTRODE  
リチウム二次電池の電極用接着剤、該接着剤を用いて製造された電極、該電極を使用したリチウム二次電池

### 摘要 [显示](#)

To provide a binder which exhibits good adhesion to a collector, while having excellent binding properties and electrolyte solution resistance, and which is capable of suppressing the internal resistance of a battery without being reduced in the content of the binder component; and to provide a lithium secondary battery which uses an electrode that is produced using this binder, and which has excellent charge/discharge characteristics. The present invention relates to a binder for electrodes of lithium

secondary batteries, which contains at least (A) a polyisocyanate, (B) a compound having one or more active hydrogen groups and a hydrophilic group and (C) an aqueous dispersion of a polyurethane resin (X) obtained using a chain extender, and wherein the acid value or the amine value of the component (X) is 40-200 mgKOH/g.

集電体に対する密着性が高く、結着性、および耐電解液性に優れ、結着剤成分の含有量を低減することなく、電池の内部抵抗を抑えることのできる結着剤を提供すること、また、この結着剤を用いて製造された電極を使用した充放電特性に優れたリチウム二次電池を提供すること。少なくとも(A)ポリイソシアネート、(B)1個以上の活性水素基と親水基を有する化合物、および(C)鎖伸張剤を用いて得られるポリウレタン樹脂(X)の分散体を含有するリチウム二次電池の電極用結着剤であって、Xの酸価またはアミン価が40~200mg KOH/gであるリチウム二次電池の電極用結着剤に関する。

MANUFACTURING METHOD OF CARBOXYMETHYL CELLULOSE SALT FOR ELECTRODE OF NONAQUEOUS ELECTROLYTE SECONDARY BATTERY, ELECTRODE FOR NONAQUEOUS ELECTROLYTE SECONDARY BATTERY, AND NONAQUEOUS ELECTROLYTE SECONDARY BATTERY

### 摘要 显示

A manufacturing method which includes: (1) an alkali cellulose reaction step wherein a mixed solvent having a mixing ratio (a mass ratio) of an alcohol having a carbon number of 3 or less and water of 75:25 to 95:5 is used, and the concentration of the base to the water is 25 to 40 mass %; (2) an etherification reaction step wherein a reaction is carried out under an excess base of 0.2 to 0.5 moles

per unit of an anhydroglucose of the cellulose; (3) a neutralization step wherein acid is added to adjust the pH of the reaction mixture to 6.0 to 8.0; and (4) a heating step wherein the mixed solvent is removed, and a base is added to adjust the pH of the reaction mixture to 8.0 to 9.0, and then a heat treatment is performed at 40 to 70° C. for 30 to 120 minutes.

**摘要** 显示

PROBLEM TO BE SOLVED: To provide a thickening/stabilizing agent for a power storage device electrode coating liquid, which has superior dispersion stability of an electrode active material and a conductive material, which never causes the reduction in viscosity owing to a stirring shear force in a dispersion step, which is superior in binding property and electrolyte resistance, and which never causes a defect such as a streak or a pin hole in an electrode.SOLUTION: A thickening/stabilizing agent for a power storage device electrode coating liquid comprises: a cellulose fiber. In the thickening/stabilizing agent, substituent groups are introduced into hydroxyl groups of cellulose molecules of the cellulose fiber; the degree of substitution is 0.01-0.5. The cellulose has a crystal structure of I-type and/or II-type. The aspect ratio of the cellulose fiber is 50 or larger. The number average fiber width of the cellulose fiber is 2-500 nm.SELECTED DRAWING: None

【課題】電極活物質や導電材の分散安定性に優れ、かつ、分散工程中に攪拌せん断力による粘度低下を起こさず、かつ結着性及び耐電解液性に優れ、かつ電極にスジ（ストリーク）、ピンホールといった欠陥が生じない、蓄電デバイスの電極塗工液用増粘・安定剤を提供する。【解決手段】セルロース纖維を含有する蓄電デバイスの電極塗工液用増粘・安定剤であって、上記セルロース纖維のセルロース分子中の水酸基に置換基が導入されており、置換度が0.01以上0.5以下であり、上記セルロースがI型及び/又はII型の結晶構造を有し、上記セルロース纖維のアスペクト比が50以上であり、上記セルロース纖維の数平均纖維幅が2nm以上500nm以下である蓄電デバイスの電極塗工液用増粘・安定剤。【選択図】なし

### 标题

METHOD FOR PREPARING CARBOXYMETHYL CELLULOSE OR SALT THEREOF, AND BINDER FOR ELECTRODE

羧甲基纤维素或其盐的制造方法以及电极粘合剂

### 摘要 显示

Provided is a carboxymethyl cellulose or a salt thereof, wherein, when the carboxymethyl cellulose or a salt thereof is used as a binder for an electrode of a non-aqueous electrolyte secondary battery, defects, such as pinholes, on the surface of the electrode are suppressed and the battery using the binder has an excellent capacity retention rate. Provided is a method for preparing a carboxymethyl cellulose or a salt thereof, the method comprising: an alkali cellulose conversion step (step 1) in which cellulose is reacted with an alkali in the presence of a mixed solvent containing water and an organic solvent; an etherification step (step 2) in which the obtained alkali cellulose is reacted with an etherifying agent for a reaction; a purification step (step 3) in which the

obtained reaction mixture is washed and dried, and a pulverization step (step 4) for pulverizing the obtained purified product, wherein step 1 is performed for a reaction time of 60-120 minutes under the conditions of a pH of 9 or higher and a reaction temperature of 5-25 DEG C.

本发明提供一种羧甲基纤维素或其盐，所述羧甲基纤维素或其盐在用作非水电解质二次电池的电极用粘合剂的情况下，抑制针孔等电极表面的缺陷，并且使用其的电池的容量保持率优异。种羧甲基纤维素或其盐的制造方法，其包括：碱纤维素化工序(工序1)，在含有水及有机溶媒的混合溶媒的存在下，使纤维素与碱进行反应；醚化工序(工序2)，使所获得的碱纤维素与醚化剂进行反应；精制工序(工序3)，对所获得的反应混合物进行清洗及干燥；以及粉碎工序(工序4)，对所获得的精制物进行粉碎；且在pH为9以上及反应温度为5°C以上、25°C以下的条件下，以60分钟以上、120分钟以下的反应时间来进行工序1。

Positive electrode active material coating material,  
positive electrode, and secondary battery

## 摘要 [显示](#)

The purpose of the present invention is to provide a positive electrode active material coating material that can provide a secondary battery having excellent battery characteristics, as well as a positive electrode and a secondary battery. A positive electrode active material coating material according to the present invention comprises a positive electrode active

material, a conductive auxiliary agent, a dispersion medium, and a dispersing agent, and is characterized in that the dispersion medium is N-methylpyrrolidone, the dispersing agent contains a polyvinyl alcohol-polyvinylpyrrolidone graft copolymer, and the content of the polyvinyl alcohol is 10-90 mass% with respect to 100 mass% for the polyvinyl alcohol-polyvinylpyrrolidone graft copolymer.

LITHIUM SECONDARY BATTERY

### 摘要

显示

PROBLEM TO BE SOLVED: To provide an incombustible lithium secondary battery having both excellent battery performance and high safety.  
;SOLUTION: In the lithium secondary battery consisting of a separator arranged between a positive electrode and a negative electrode and a nonaqueous electrolyte including lithium salt, the negative electrode includes a graphitization retarding carbon, and the nonaqueous electrolyte uses an ionic liquid as a solvent including bis(fluorosulfonyl)imide anion as an anion component. It is preferable that the negative electrode includes the graphitization

retarding carbon of 5-100 wt.%. Furthermore, the ionic liquid includes a cation including a nitrogen atom as a cation component, and it is preferable that the cation including the nitrogen atom is one or a plurality of mixtures selected from alkyl ammonium, imidazolium, pyrrolidinium, and piperidinium.

### 摘要 显示

Provided is a composition which contains cellulose fibers and non-cellulose powder granules and has excellent redispersibility in a polar solvent such as water. A composition according to an embodiment is a redispersible composition which contains at least (A1) cellulose fibers having a number average shorter-width of 2 to 1000 nm inclusive, (B) non-cellulose powder granules and (C) water, wherein the content of the non-cellulose powder granules (B) is 14.0 to 98.4% by mass inclusive relative to the whole mass of the composition, the content of the water (C) is 0.6 to 72.0% by mass inclusive relative to the whole mass of the composition, and the mass ratio of the content of the cellulose fibers (A1) to the content of the non-cellulose powder granules (B), i.e., (A1)/(B), is 1.0/99.0 to 50.0/50.0 inclusive.

セルロース纖維と非セルロース粉粒物とを含有する組成物において、水等の極性溶媒への再分散性に優れた組成物を提供する。実施形態に係る組成物は、(A1)短幅の方の数平均幅が2nm以上1000nm以下のセルロース纖維と、(B)非セルロース粉粒物と、(C)水を少なくとも含有する組成物で

あって、前記( B )非セルロース粉粒物の含有量は、前記組成物の全質量に対して 14.0 質量%以上 98.4 質量%以下であり、前記( C )水の含有量は、前記組成物の全質量に対して 0.6 質量%以上 72.0 質量%以下であり、前記( A1 )セルロース纖維の含有量と前記( B )非セルロース粉粒物の含有量との質量比率( A1 ) / ( B )が 1.0 / 99.0 以上 50.0 / 50.0 以下である、再分散可能な組成物である。
